

Place the electrical distribution box in the master bedroom

Summary of Content

Installing a distribution box in a master bedroom is possible but requires strict adherence to safety codes, proper placement, and careful planning to ensure compliance and minimize hazards.

Safety and Code Considerations

While the National Electrical Code (NEC) does not explicitly forbid placing a distribution box in a bedroom, there are strict limitations. Panels cannot be installed in closets, bathrooms, or over stairways due to fire and accessibility risks. In a bedroom, care must be taken to avoid placing the panel near combustible materials or in areas where furniture or storage could obstruct access or violate NEC Section 240.24(D) regarding overcurrent device clearance . All circuits in the bedroom must be protected by Arc Fault Circuit Interrupters (AFCI) to prevent fire hazards .

Placement and Accessibility

The recommended height for a residential distribution box is approximately 1.5 meters (5 feet) from the floor, which keeps it accessible for operation while reducing the risk of accidental contact . The box should be installed in a dry, well-ventilated area with sufficient clearance around it for maintenance and airflow. Avoid areas near water sources, heating vents, or high-traffic zones to prevent damage and ensure safety .
