

Portuguese Lighting Distribution Box Circuit

Summary of Content

In Portugal, lighting circuits are typically managed via radial distribution boxes, which safely distribute power to multiple lighting circuits while complying with local regulations.

Overview of Portuguese Lighting Circuits

In Portugal, electrical installations, including lighting circuits, follow the radial system, unlike the UK's ring system. Each circuit runs independently from the distribution box to the load, which improves safety and simplifies fault detection. Only certified electricians recognized by the Portuguese regulator can legally perform wiring, and compliance is required for habitation licenses and insurance coverage.

Distribution Box (DB) Components

A distribution box (DB box) is the central hub for electrical circuits, including lighting. Its main functions are to distribute power safely, protect circuits, and organize wiring. Key components include:

- Circuit breakers: Protect individual lighting circuits from overloads or short circuits.
- Fuses: Provide additional protection for specific circuits.
- Bus bars: Conduct electricity from the main supply to multiple circuits.
- Indication lights: Show the status of mains power.
