

Practical Drop Fiber Cable

Summary of Content

Fiber optic drop cables are the critical last-mile link connecting the main network to end users, designed for aerial, underground, and indoor deployment with high reliability and flexibility.

Overview

A fiber optic drop cable is the final segment of the Optical Distribution Network (ODN), connecting the distribution terminal (like a Fiber Access Terminal or FAT box) to the subscriber's premises (Optical Network Unit or ONU) and delivering high-speed internet, voice, and video services directly to the end user . Unlike backbone cables, drop cables typically have 1 to 4 fibers, are lightweight, flexible, and designed to handle tight bends without significant signal loss .

Types of Drop Cables

- Aerial Drop Cables
 - Suspended between poles or overhead structures.
 - Feature a strong outer jacket for UV, wind, and temperature resistance.
 - Often include a metallic or FRP strength member for support.
 - Self-supporting figure-8 designs allow spans up to 50 meters, with specialized designs exceeding 80 meters .
- Underground Drop Cables
 - Directly buried in trenches or conduits.
 - Include water-blocking layers and rodent-resistant jackets.
