

Principles for Selecting Optical Cables for High-Voltage Lines

Overview

Key Takeaway: On transmission lines rated 110 kV and above, ADSS cables must use AT (Anti-Tracking) jacket material. ntly, there are a limited number of industry documents that address the requirements for optical fiber cables near high voltage circuits. One standard that has been developed by the Institute of Electrical and Electronics Engineers, Inc (IEEE) is 1222, "IEEE Standard for All-Dielectric. As we approach the half century mark for the dawn of the era of optical communications, it is appropriate to take stock of the journey of discovery and application of this empowering technology. For lines below 110 kV where the space potential at the attachment point is ≤ 12 kV, PE (Polyethylene) jacket is sufficient. Besides traditional cables lashed to messengers, figure-8 cables or ADSS cables, utilities can construct transmission links using optical ground wire (OPGW) or optical power phase conductor (OPPC). High-voltage power cables are crucial components of modern electrical power systems, enabling safe and reliable power transmission from generation sources to industrial plants, substations, and large-scale infrastructure.
