

# Raman fiber amplifier noise

## Overview

Raman fiber amplifiers can have a lower noise figure. On the other hand, they more directly couple pump noise to the signal than laser amplifiers do. They also have a fast reaction to changes in the pump power, particularly for co-propagating pump, and very different. A Raman amplifier is an optical amplifier based on Raman gain, which results from the effect of stimulated Raman scattering in some Raman gain medium. The effects of pump power and length are investigated as well as the noise transferred between pump and signal. Relative intensity noise (RIN) is also studied showing the effect of Raman on-off gain and dispersion. Three different amplifier. There are a number of applications where Single Frequency (SF) narrowband seed sources need to be amplified while maintaining spectral purity and with a minimum amount of added noise. Laser cooling of atoms often requires high power sources with very specific frequencies matching atomic transitions.
