

Relay protection device setting value

Overview

Protection relay setting is the process of choosing the current threshold and time delay at which a relay trips a circuit breaker during a fault. The goal is to isolate only the faulted section — quickly enough to protect equipment, but with enough delay to let downstream relays act. These values are core to everyday tasks like setting up industrial distribution panels, utility feeders, or backup generator protection. You'll find the actual relay setting equations, a worked example, some background on the IEC 60255 curves, and a direct FAQ further down — all with an emphasis on. Protection relays employ a wide range of configurable parameters to identify defects & trip the breaker in a controlled & selected manner. PSM – Plug Setting Multiplier (Current Setting Multiplier) What is PSM?

2). For earth fault relay it is from 10% to 70% in steps of 10%. Suppose we have connected on. This technical report refers to the electrical protections of all 132kV switchgear. All calculations are based on the available documentation/ information.
