

Remove the core switch

Summary of Content

Removing or replacing a core switch requires careful planning, configuration migration, and staged connection transfers to minimize network downtime and avoid IP conflicts.

Understanding the Core Switch Role

A core switch is the backbone of a hierarchical network, responsible for routing and switching large volumes of data to distribution and access layers. Its performance directly affects the entire network, so replacing it requires careful attention to configuration, connectivity, and redundancy .

Preparation Steps

- Document the Current Network: Record all VLANs, IP addresses, routing protocols, HSRP/VRRP configurations, and interface mappings.
- Preconfigure the New Switch: Apply the bulk of the old switch's configuration to the new device, including SVIs, routing protocols, AAA, and security settings .
- Check for IP Conflicts: Ensure that any loopback addresses or management IPs on the new switch do not conflict with the old switch while both are online .

Replacement Strategies

Option 1: Direct Swap (Downtime Acceptable)

- Shut down the old core switch during a maintenance window.
- Connect all cables to the new switch.
- Verify connectivity and routing.
