

Replacing the router with mobile fiber optic cable

Summary of Content

You cannot directly replace a mobile router with a fiber optic cable; instead, you connect fiber through an ISP-provided ONT to a compatible router.

Understanding Fiber Optic Internet

Fiber optic internet delivers data via light signals through glass or plastic strands, offering much higher speeds, lower latency, and greater reliability than mobile LTE or 5G connections . Unlike mobile routers, fiber connections require an Optical Network Terminal (ONT), which converts the light signals into electrical signals that your router can use .

Equipment Needed

- Optical Network Terminal (ONT): Provided by your ISP; essential for converting fiber signals. You cannot replace the ONT with a standard modem .
- Compatible Router: Must have a Gigabit Ethernet WAN port to connect to the ONT. Wi-Fi 6 or 6E routers are recommended to fully utilize fiber speeds .
- Ethernet Cable: Connects the ONT to your router's WAN port.
- Fiber Optic Cable: Typically a thin yellow cable with SC/APC or SC/UPC connectors, running from the wall outlet to the ONT .

Steps to Transition

- Confirm ONT Installation: Ensure your ISP has installed and activated the ONT at your home .
