

Splitter Card Type

Summary of Content

A card-type splitter is a modular PLC optical splitter designed for efficient fiber optic signal distribution in PON and FTTH networks.

Overview

A card-type splitter is a type of PLC (Planar Lightwave Circuit) optical splitter that distributes optical signals from a single input fiber to multiple output fibers. It is a passive optical component, meaning it does not require power to operate, and is widely used in fiber optic networks for signal branching and distribution .

Structure and Design

- **Modular Card Form:** The splitter is mounted on a card or cassette, which allows easy insertion into optical distribution frames (ODF) or fiber cabinets .
- **Adapter Interfaces:** Common interfaces include SC, FC, and LC, with UPC or APC polishing types for low insertion loss .
- **Durability:** Card-type splitters are made from high-quality materials that resist temperature fluctuations, humidity, and mechanical stress, making them suitable for both indoor and outdoor environments .
- **Compact Design:** The cassette or card format allows vertical installation in standard 19-inch or 21-inch racks, optimizing space in network cabinets .

Applications

- **FTTH Networks:** Used at primary or secondary splitting points to distribute optical signals to multiple subscribers .
