

Steps and Techniques for Pigtail Splicing

Summary of Content

Fiber optic pigtail splicing involves preparing the fibers, aligning them precisely, and fusing or mechanically joining them to ensure a low-loss, reliable connection.

Required Tools and Materials

- Fusion Splicer: Uses an electric arc to melt and join fiber ends.
- Fiber Strippers: Remove the outer jacket and coating without damaging the glass core.
- High-Precision Cleaver: Cuts the fiber at a perfect 90-degree angle for optimal fusion.
- Cleaning Supplies: Lint-free wipes and 99% isopropyl alcohol to remove debris and oils.
- Heat-Shrink Splice Protection Sleeves: Protect the fragile splice after fusion.

Step-by-Step Procedure

- Prepare the Fiber
- Strip the outer jacket and coating from both the incoming fiber and the pigtail using fiber strippers.
- Clean the exposed glass thoroughly with lint-free wipes and isopropyl alcohol until it is free of dust and oils.
- Cleave the Fiber
- Use a high-precision cleaver to cut both fiber ends at a perfect 90-degree angle. This ensures a smooth surface for fusion and minimizes signal loss.
