They are characterized by high port density, cost-effectiveness, security features at the edge, and often PoE support. It contains three layers: core, distribution, and access. The access layer provides initial. Access Layer: The access layer is the layer where access devices are installed. Each layer is served by specialized switches, with the access switch connecting end-user devices, the distribution switch aggregating traffic and enforcing policies, and the core switch acting as. In enterprise networking, the hierarchical three-tier model is divided into three distinct roles: access switches (which connect end-user devices to the network via Layer 2), distribution switches (which route inter-VLAN traffic and enforce security policies at Layer 3), and core switches (which. This model split the network into three distinct layers: This wasn't just a slight improvement—it was a revolution in network design. Suddenly, networks could scale.
