

The Function and Uses of Lighting Modules in Singapore

Summary of Content

The Singapore lighting module functions as an integrated control unit that enables adaptive, energy-efficient, and automated lighting within smart lighting networks.

Core Functionality

The lighting module in Singapore's smart lighting systems acts as a control and communication transceiver that interfaces with LED drivers or light-sensitive components in luminaires. It allows for individual or group control of lights, including switching, dimming, scene management, and automation, all within a wireless network using Bluetooth Low Energy (BLE) mesh communication. Each module operates as a mesh node, enabling secure, low-latency, and scalable distributed control without the need for additional cabling.

Adaptive and Energy-Efficient Operation

Equipped with sensors and AI-powered self-optimization, the module continuously adjusts lighting based on real-time conditions such as occupancy, daylight levels, and environmental changes. This ensures communal areas remain illuminated adaptively, maintaining a comfortable ambience while reducing energy consumption. The system can maintain a 10% safety glow to avoid total darkness and can predictively illuminate paths in advance, enhancing both safety and efficiency.
