

The distribution box only has a green light

Summary of Content

A green light on a distribution box or GFCI typically indicates that the device is powered and its internal electronics are functioning, but it does not guarantee that electricity is being delivered to the outlets or connected devices.

What the Green Light Means

For GFCI outlets, a solid green light usually signals that the unit has passed its self-test, the internal electronics are receiving power, and the safety protection feature is active and operational. Similarly, in distribution boxes like the PA0242, status LEDs indicate the operational state of the current loops and controller connections, with green often representing normal function.

Why Power May Not Reach Devices

Even with a green light, the device may fail to deliver power due to:

- Tripped circuit breakers upstream or in the main panel, which may appear partially engaged and need a full reset.
- Miswired circuits or disconnected line/load wires, which prevent electricity from reaching the outlet or dispenser loops.
- Faulty downstream devices or additional GFCI outlets in series that have tripped, interrupting the power path. The green light only confirms that the internal electronics are energized and ready to protect the circuit; it does not confirm that the mechanical contacts are passing current to the load.
