

The router is installed on the fiber optic panel

Summary of Content

The router does not connect directly to the fiber optic panel; it connects to an Optical Network Terminal (ONT) that converts the fiber signal into Ethernet for the router.

Role of the ONT

Fiber optic cables transmit data as light pulses, which standard routers cannot interpret directly. The Optical Network Terminal (ONT) acts as a bridge, converting the optical signals from the fiber into electrical signals that your router can use. The ONT is typically installed near the fiber entry point, often on a wall or in a closet, and contains an optical port for the fiber cable and an Ethernet port for the router.

Connecting the Router

- **Fiber to ONT:** The fiber optic cable from the panel is plugged into the ONT's optical input port. Protective caps should be removed carefully, and the connector handled by its housing to avoid damage.
- **ONT to Router:** Use a high-quality Ethernet cable (Cat6a or higher) to connect the ONT's Ethernet port to the router's WAN port.
- **Power and Configuration:** Power on the ONT and wait for the status lights to stabilize. Then power on the router and configure it via its admin interface, typically accessed through a web browser at an IP like 192.168.1.1.

Best Practices

- **Placement:** Position the ONT close to the fiber entry point to minimize signal loss.
