

Theoretical load-bearing capacity of mesh cable trays

Overview

IEC 61537 does not specify exact load-bearing values for cable trays. Lateral deflection: less than $1/20$ of the width. Flextray wire basket features load capacity that surpasses the maximum tray fill. Challenge: The National Electrical Code (NEC 392-9) limits the amount of cable tray that can be added into any tray based on the type and size of the cables supported. For data cables, NEC limits cable fill to 50% of. Use the recommended quantity of UL Classified splices to connect sections and at places where the tray is cut. (This method is recommended by NEMA VE-2 Installation. The Wire Mesh / Cable Tray Fill table in below section shows the number of cables and the load in lbf/lineal foot developed by typical 4 pair and 6 pair cable weighing 20 lb/kft and 40 lb/kft, respectively. You don't need a PhD—just a consistent method. This step-by-step approach helps you determine width, depth, support spacing, and allowable load with confidence. Group by power. Wire Mesh Cable Trays: Lightweight, flexible, and easy to install, perfect for applications requiring superior heat dissipation.
