

UPS wiring in distribution box

Summary of Content

A UPS can be wired to a distribution box to provide uninterrupted power to selected circuits by connecting its output through dedicated MCBs while ensuring proper input from the main supply for battery charging.

Key Steps for Wiring a UPS to a Distribution Box

1. Identify Critical Circuits: Select the circuits or rooms that require uninterrupted power, such as computers, lighting, or essential appliances. Only these circuits will be connected to the UPS output, while other loads remain on the main supply . 2.

Disconnect Selected Circuits: From the main distribution board, disconnect the live (phase) wires of the chosen circuits. These wires will be rerouted through the UPS output via dedicated single-pole MCBs . 3. Connect UPS Output:

- Connect the UPS output to the dedicated MCBs for the selected circuits.
 - Ensure the neutral wire is properly connected; in most setups, the UPS shares the neutral with the main supply .
 - Use appropriately sized conductors, typically 6 AWG (16 mm²) for standard home UPS systems, to handle the load safely . 4. Connect UPS Input for Charging: The UPS input should be connected to the main supply through a double-pole MCB or a suitable plug and socket. This allows the UPS battery to charge while the main power is available . 5. Safety Precautions:
- Always switch off the main supply before making connections.
 - Follow local electrical codes and regulations.
 - Ensure all connections are secure and the UPS is properly grounded .
