

What are some imported high-grade fiber melting trays

Summary of Content

Imported high-grade fiber melting trays are durable, customizable trays made from materials like fiberglass, bamboo fiber, or PLA, designed for industrial, telecommunications, and laboratory applications.

Materials and Construction

High-grade fiber melting trays are typically made from glass-reinforced composites, fiberglass, or natural fibers like bamboo combined with PLA or corn starch. Fiberglass trays are lightweight yet strong, often 40% lighter than standard trays while retaining durability, and can be formulated to dissipate electrostatic discharge, making them suitable for sensitive electronics or pharmaceutical applications (MFG Tray) . Bamboo fiber trays are eco-friendly, biodegradable, and food-safe, often used in packaging or laboratory settings .

Applications

These trays are used in a variety of industries:

- Telecommunications and FTTH projects: Fiber optic splice trays store and protect fiber cables, supporting 6–24 fibers per tray and accommodating ribbon or single-mode fibers .
- Pharmaceutical and laboratory processing: Fiberglass trays handle vials, gel caps, and other materials, integrating with automated machinery while maintaining hygiene and durability .
