

What are the special tools for threading fiber optic cables

Summary of Content

A fiber optic cable puller or fish tape is the essential tool for threading fiber optic cables through conduits or ducts.

Primary Tool for Threading

The fiber optic cable puller (also called a cable pulling device) is the key tool used to guide fiber optic cables through conduits, ducts, or other pathways safely and efficiently. For smaller or more confined spaces, fish tape or a cable rodder is often used to thread the cable before pulling it with a mechanical puller. These tools prevent excessive bending, kinking, or stress on the delicate glass fibers inside the cable, which could otherwise cause signal loss or breakage.

Supporting Tools

While the puller or fish tape is essential, several supporting tools are critical for a successful installation:

- Cable Strippers and Slitters: Remove protective jackets and coatings without damaging the fiber core.
- Kevlar Shears: Cut the aramid fibers inside armored cables cleanly.
- Splicing and Termination Kits: Fusion splicers, cleavers, and polishing tools are used after threading to join or terminate fibers.
- Inspection and Cleaning Tools: Microscopic inspection scopes and cleaning kits ensure connectors and fibers are free of dust or scratches.
