

What layer does the core switch belong to

Overview

A core switch is a high-capacity, high-performance Layer 3 switch positioned at the physical backbone of an enterprise network. Engineered to aggregate massive volumes of data from distribution switches, it provides ultra-low latency and maximum throughput to ensure uninterrupted routing and packet. It is a powerful backbone switch in the center of the network core layer, which centralizes multiple aggregation switches to the core and implements LAN routing. The normal edge switch is in the access layer to directly connect multiple end devices. It can be considered a central network layer that performs all the functions, like monitoring traffic and empowering the whole system. When it comes to the naming of switches, you can use. A core switch is the backbone of a large-scale network, designed to handle massive volumes of traffic with ultra-low latency and maximum reliability. Simply put, it's the kingpin that keeps your network humming.
