

Where should the distribution box be installed

Summary of Content

A distribution box should be installed in a dry, accessible, and well-ventilated area, away from water, flammable substances, and corrosive materials, typically at a height of around 1.5 meters for residential setups.

Ideal Locations

Residential Installations: Distribution boxes are commonly installed in electrical rooms, basements, corridors, or utility closets. They should be easily accessible for maintenance and close to the main power supply to facilitate safe connections and inspections . **Commercial Installations:** In office buildings, shopping malls, or other commercial facilities, distribution boxes should be placed in dedicated electrical rooms or service areas. The location must allow for easy access by electricians and maintenance personnel while keeping the box away from high-traffic areas to prevent accidental damage . **Industrial Installations:** Industrial distribution boxes are often installed in factories, workshops, or construction sites. They must withstand harsh conditions such as high temperature, humidity, dust, or vibration. Placement should ensure protection from water and corrosive substances, and may require enclosures with higher IP or NEMA ratings for outdoor or challenging environments .

Key Considerations

- **Accessibility:** Ensure the box is easy to reach for maintenance, inspections, and emergency shut-offs .
- **Height:** Residential boxes are typically installed about 1.5 meters above the ground. Industrial boxes may vary depending on surrounding equipment and space .
