

Which class does the trademark for cable trays belong to

Summary of Content

Cable trays are typically registered under Trademark Class 6, which covers metal goods, hardware, and building materials.

Cable trays, as components of support systems for electrical power and communication cables, are primarily made of metal such as steel or aluminum alloy, which ensures strength and durability, making them fall under Class 6 in the international trademark classification system . This class includes goods made substantially of metal, including hardware and structural components used in construction and electrical installations .

Material Considerations

While most cable trays are metallic, some are made from non-metal materials like fiberglass or polymer. These non-metal trays offer benefits such as corrosion resistance and lighter weight, but for trademark purposes, metal cable trays are the standard reference for Class 6. Non-metal trays may require consideration under other classes depending on their material composition and intended use .

Function and Classification

Cable trays are not raceways but are treated as structural components of electrical systems, supporting, routing, and protecting cables. Their classification under Class 6 aligns with their role as building and construction hardware rather than electrical devices themselves .
