

Wireless wiring in distribution box

Summary of Content

Wiring a wireless distribution box involves safely connecting power and network cables while configuring the access points for wireless bridging or repeating using WDS technology.

Physical Setup

- **Choose the Right Box:** Select a distribution box suitable for your environment (indoor/outdoor) with proper IP/NEMA ratings and durable material like steel or plastic for protection against dust and moisture .
- **Mount the Box:** Install the box at an accessible height, typically around 1.5 meters, in a dry, ventilated area .
- **Power Connections:** Ensure the main power is turned off before wiring. Connect the incoming live wire to the main terminal, and secure grounding properly to prevent electrical hazards .
- **Circuit Connections:** If the box includes multiple circuits for powering access points, connect each outgoing circuit to its respective breaker or fuse, ensuring correct wire gauge and insulation .
- **Cable Management:** Use cable entry points and DIN rails if available to keep wires organized and prevent strain on connections .

Wireless Configuration (WDS)

- **Understand WDS:** Wireless Distribution System allows access points (APs) to communicate wirelessly, either by repeating signals or bridging multiple APs, without requiring a wired backbone .
