

Wiring number for motor distribution box

Summary of Content

Wires in a motor distribution box are numbered using a standardized system that links each wire to its circuit, function, and terminal, ensuring clear identification and traceability.

Standard Numbering Principles

- **Electrical Identification Number (EIN):** Each motor distribution box or motor control center (MCC) is assigned a unique Electrical Identification Number. This number is used as a prefix for all circuits and cables associated with that equipment, forming the basis for wire numbering .
- **Power Circuit Reference (PC):** Every circuit fed from the distribution box is given a PC reference number, which is shown on schematics and on the equipment label. For example, an incomer circuit breaker might be labeled as M101 .
- **Cable Numbering:** Power and control cables are numbered based on the PC reference. If multiple cables are connected to the same circuit, they are suffixed alphabetically (A, B, C) or sequentially for parallel cables (e.g., /1, /2) . Single-core cables are numbered with a dash and sequential number (e.g., /L1-1, /L2-1, /L3-1) .
- **Wire Numbering Methods:**
 - **Printed Wire Numbers:** Wires often have numbers printed on their insulation at regular intervals for easy identification .
 - **Terminal End Labels:** Both ends of the wire are labeled near terminal blocks, contactors, or relays using tags or small plates .
 - **Sequential Numbering:** Wires can be numbered sequentially according to the wiring diagram or connection sequence (e.g., 1, 2, 3...) .
