

Wiring of Huijue Distribution Box

Summary of Content

Wiring a Huijue distribution box requires proper wire sizing, circuit allocation, grounding, and neat cable management to ensure safety, reliability, and compliance with standards.

Wire Sizing and Circuit Allocation

- Lighting and socket circuits typically use 2.5mm² wires, with no more than three circuit breakers connected in series per wire.
- Air conditioning circuits generally use 2.5mm² or 4.0mm² wires, with one wire per circuit breaker to handle higher loads safely.
- Ensure that the cross-sectional area of wires matches the load current requirements to prevent overheating and voltage drop .

Wiring Practices

- Neutral wires must not be shared between circuits. Each phase-distributed wire should have its own neutral directly connected to the neutral terminal of the corresponding circuit breaker .
- Wire bending should be smooth, avoiding dead bends to prevent insulation damage.
- Unused wire lengths should be trimmed after securing with cable ties.
- Cable ties should be appropriately sized and spaced uniformly, typically every 100mm, to maintain neatness and prevent strain on connections .
