

Wiring of the three-level power distribution box in the factory

Overview

In the 3-phase distribution box, the MCCB is used as the main switch. Only Line terminals go through the MCBs. Three-phase distribution boards are used in large factories, buildings, manufacturing units. (1) Power distribution from the primary main distribution board (distribution cabinet) to secondary distribution boards can be branched; that is, one main distribution board may supply power via multiple branch circuits to several secondary distribution boards. used to control and safely distribute the power supply to the electric appliances and devices. A distribution board is also known as main breaker box, electric. Connection method: Each switch takes a wire from the incoming point and connects it to the incoming end of the switch, or uses parallel connection to reduce the difficulty of wiring. Wiring Direction: Wiring between the main circuit breaker and each branch circuit breaker in the box generally. Picture your factory's power distribution system like the circulatory system of a living organism. Electricity flows through this network like lifeblood, energizing every machine, sensor, and light fixture that makes production possible. Big buildings with many floors.
