

Wiring through the wall of the distribution box

Summary of Content

Proper wiring of a distribution box involves securely connecting incoming and outgoing circuits, organizing wires neatly, and ensuring safety through correct insulation, grounding, and labeling.

Installation and Mounting

Before wiring, the distribution box should be securely mounted on a dry, ventilated wall at an accessible height, typically around 1.5 meters. Use expansion bolts or appropriate fasteners to ensure stability, and select a waterproof or indoor-rated box depending on the environment . Ensure the installation site is free from flammable, corrosive, or obstructive materials .

Wiring Connections

- **Power Off:** Always turn off the main power supply and verify with a tester before starting .
- **Incoming Wires:** Connect the incoming live wire (usually brown or red) to the main terminal, the neutral wire to the neutral bus, and the ground wire to the grounding bar .
- **Circuit Breakers:** Install circuit breakers in their designated slots and connect each branch circuit wire to the corresponding breaker .
- **Outgoing Circuits:** Wire the outgoing circuits according to the load requirements, ensuring each wire is correctly marked for identification .
